**Strengthening Families So Young Children Thrive:**

Evaluation Findings from a Zambian Early Childhood Development Program for Children Affected by HIV/AIDS

**PROGRAM STRATEGY**

**A Community-Led, Holistic Approach**

**GOAL:** Strengthen parents’ and other primary caregivers’ nurturing care and early stimulation of their young children, while supporting vulnerable families to improve their health, nutrition and livelihoods.

**THEORY OF CHANGE**

- Increased knowledge of HIV prevention and transmission
- Caregivers cited changes in attitudes that destigmatized HIV and encouraged testing
- Improved care for children whose parents had died of HIV/AIDS after people understood how HIV/AIDS is transmitted
- Trusted relationships through peer groups and home visits contributed to increase in parents’/primary caregivers coming forward for HIV testing and treatment, if positive

**ECD PROGRAM**

- 6,228 Families
- 9,936 Children Under 5
- 53 Rural Communities
- 53 ECD Management Committees
- 49% Participating families affected by HIV/AIDS

**ECOMMENT**

- 742 ECD Volunteers
- 55% Facilitated monthly:
  - Home Visits
  - Primary Caregiver Support & Learning Groups
  - Children’s Playgroups

**EVALUATION METHODOLOGY**

**Mixed Methods:** Quantitative and qualitative

**Sampling Method:** Multi-stage, non-random sampling with probability proportionate to size

**Study Participants:** Primary caregivers, ECD volunteers, staff

**Longitudinal Survey:** 2014-2016

**Quasi-Experimental Design:** comparing outcomes between program participants and unexposed primary caregivers with a similar profile (simple control group)

**CONCLUSIONS**

**Parenting Empowerment**

The program had a significant impact in strengthening parent-child relationships and interactions, thereby improving the development of the most vulnerable young children.

**Community Ownership and Networks**

The strong sense of community ownership, leadership committee structures and extensive network of multi-sectoral stakeholders created a solid basis for sustainability.

**Program Replicability**

The program provides an integrated, cost-effective model replicable in other rural settings in Africa with similar demographic characteristics. The model should be scaled up to provide equitable access to improving child development outcomes, particularly for children affected by HIV and other vulnerabilities.

**Key Findings**

1. **ECD Volunteers Were Effective Change Agents**
   - Gained sound knowledge of ECD and parenting practices
   - Acquired facilitation and social and behavior change communication skills
   - Worked effectively with primary caregivers:
     - Developed trusted relationships
     - Promoted adoption of parenting practices
     - Provided psychosocial support
     - Made referrals and linked families to needed services

2. **Picture-Based Dialogues Changed Parenting Behaviors**
   - During home visits and peer group meetings, volunteers used the Essential Package Visual Guides—Critical Needs and Actions for Young Children and for Caregivers and a parenting skills manual’s picture cards
   - Primary caregivers cited volunteers’ use of pictures as giving them a better understanding of critical parenting actions and motivating them to try new practices

3. **Combination of ECD Home Visits and Peer Groups Provided Reinforcing Benefits**
   - Home Visits
     - Primary caregivers received one-on-one attention for their particular issues in a confidential setting
   - Primary Caregiver Support & Learning Groups
     - Primary caregivers gained new information, learned from others’ questions, shared how they solved common parenting problems, positively influenced each other to practice what they learned and provided mutual support

4. **Reduced Stigma Around HIV/AIDS and Increased HIV Testing**
   - Increased knowledge of HIV prevention and transmission
   - Caregivers cited changes in attitudes that destigmatized HIV and encouraged testing
   - Improved care for children whose parents had died of HIV/AIDS after people understood how HIV/AIDS is transmitted
   - Trusted relationships through peer groups and home visits contributed to increase in parents/primary caregivers coming forward for HIV testing and treatment, if positive

5. **Increased Nurturing Care and Stimulation**
   - Increased frequency and duration of intentional parent-child interaction
   - Caregivers in the ECD Program spent 50% more time interacting with their children each day than caregivers in the control group
   - Increased quality of interaction

6. **Changed Attitudes and Behavior: Fathers’ Role in Parenting**
   - Fathers reported new understanding of the importance of men taking an active role in care and nurturance
   - Fathers’ increased their interaction with children by:
     - Taking, storytelling and playing with children
     - Helping take care of children
     - Taking children to growth monitoring and health services

7. **Improved Health, Nutrition and Livelihoods**
   - Increased health and nutrition knowledge and practices by primary caregiver which led to improved child health and nutrition
   - Increased economic strengthening through formation of caregiver-run savings & loan groups and development of social funds to assist members with emergency needs

**Evaluation Findings from a Zambian Early Childhood Development Program for Children Affected by HIV/AIDS**

**Key Findings**

- **30% Increase**
  - Largest impact in cognitive, language and motor skills development activities
  - **Before:** Less than 50% of children were engaged with caregivers in these activities
  - **After:** 80% of children engaged with caregivers in these activities

**Social and emotional development activities**

- 55% were higher at baseline but also increased significantly.

**Primary Caregiver Support & Learning Groups**

- **CHANGED PARENTING BEHAVIORS**
  - Picture-based dialogues
  - Promoted adoption of parenting practices
  - Developed trusted relationships
  - Primary caregivers reported immediate changes in their children’s behavior and development as a result of their new parenting practices

**Key Findings**

- **30% Increase**
  - Largest impact in cognitive, language and motor skills development activities
  - **Before:** Less than 50% of children were engaged with caregivers in these activities
  - **After:** 80% of children engaged with caregivers in these activities

- **Social and emotional development activities**
  - 55% were higher at baseline but also increased significantly.

**Primary Caregiver Support & Learning Groups**

- **CHANGED ATTITUDES AND BEHAVIOR:**
  - Fathers reported new understanding of the importance of men taking an active role in care and nurturance
  - **Fathers’ increased their interaction with children by:**
    - Taking, storytelling and playing with children
    - Helping take care of children
    - Taking children to growth monitoring and health services

**Impaired Health, Nutrition and Livelihoods**

- Increased health and nutrition knowledge and practices by primary caregiver which led to improved child health and nutrition
- Increased economic strengthening through formation of caregiver-run savings & loan groups and development of social funds to assist members with emergency needs

**Conclusions**

- **Parenting Empowerment**
  - The program had a significant impact in strengthening parent-child relationships and interactions, thereby improving the development of the most vulnerable young children.

- **Community Ownership and Networks**
  - The strong sense of community ownership, leadership committee structures and extensive network of multi-sectoral stakeholders created a solid basis for sustainability.

- **Program Replicability**
  - The program provides an integrated, cost-effective model replicable in other rural settings in Africa with similar demographic characteristics. The model should be scaled up to provide equitable access to improving child development outcomes, particularly for children affected by HIV and other vulnerabilities.
